

*Metasearch engines* are Internet search engines that submit your search to other search engines. The best of the metasearch engines are SearchOnLine, Dogpile, Mama, and Webcrawler. The metasearch engines advertise that they are superior to any one search engine because they report results from four or five major Internet search engines. Although this is useful for some purposes, it is not the best means to conduct debate research. The metasearch engine sends a simple search request to other search engines, meaning you are foregoing the opportunity to use the advanced search function that almost all major search engines make available to you. This means you often lose the capability to do exact phrase searching, limitation by date, limitation by domain, and limitation by file type. It is also often true that you receive fewer hits from each of the major search engines than if you were to issue the search from directly within that search engine.

The *domain* of a web page tells you something about the origin of that page. Each web page on the Internet has a closing three-letter code such as *.com*, *.edu*, *.gov*, or *.net*—this is its domain. In most instances, the *.edu* domain means the web page is housed in or provided by a college or university. The *.gov* domain means the web page is maintained by a federal, state, or local government. The *.com* and *.net* domains usually mean a commercial enterprise hosts that page. Most of the major search engines (in the advanced search options) allow you to limit a search to particular domains.

*PDF* stands for portable document file and indicates that a document is being made available in a format that will look just like an original document in print (complete with page numbers). PDF files are designed to be viewed and printed in Adobe Acrobat Reader (available free for download from the Internet). The advantage for the debater is that information gathered from a PDF file can be cited at a particular page number (the same page number it would have if you had access to the original printed document). Almost all congressional hearings (starting with the 105th and 106th Congresses) are available in PDF format. This not only means that you can download a hearing that's identical to the printed one, but it also means you have almost immediate access to a hearing after it has been held.

PDF files also carry the advantage that they are usually made available from well-established sources on the Internet. Again, however, the software necessary to “read” PDF documents is available free on the Internet. You will know that a document for download is available in PDF format if the Internet URL ends in *.pdf*. Most of the major search engines allow you to search for only those web pages that make a PDF download available.

*HTML* stands for HyperText Markup Language and is the code used for creating web pages. You don't really need to be an HTML programmer to be able to write a web page because numerous programs such as Netscape Composer and Microsoft FrontPage
